An analysis of finding optimal location for residential centers in Tabriz through the AHP approach

Date received: 10 April 2011 Date accepted: 7 May 2012

Abstract
In planning recreational centers, considering the method of locating and spatial organization with regard to the geographic scale of the place plays an important role. The aim of this study is to determine suitable location for constructing residential centers in Tabriz using Analytic Hierarchy Process model in Expert Choice software and Geographic Information System. This study is a descriptive-analytical study and applies library and field data collection methods. Analytic Hierarchy Process (AHP) is a multi-criteria decision making technique used in locating. In locating process through this method, after determining hierarchy levels including objective, criteria, sub criteria and alternatives, pairwise comparisons were performed between categories for weighting. While weighting the categories, the analysis of compatibility of judgments was also performed. After weighing all criteria, sub criteria and
